DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 3-10, 12-17, 19-26 and 28-32 are allowed.
2. The following is an examiner's statement of reasons for allowance:

Applicant invention is drawn to a system and method to reduce echoes in voice communications. A processor receives input data containing return loss values measured at each frequency of a plurality of frequencies within a predetermined frequency band of a communication trunk within a communications network. Using the input data received, the processor calculates optimum transhybrid balance impedance and transmits the calculated optimum transhybrid balance impedance to a user for further processing.

Prior art of record failed to teach or fairly suggest in combination the method and system for reduce echoes in voice communications comprising a memory to store a plurality of return loss profiles, each return loss profile corresponding to a transhybrid balance impedance of a communication trunk within a communications network; and a processor coupled to said memory to receive input data containing return loss values of said communication trunk, said return loss values measured at each frequency of a plurality of frequencies within a predetermined frequency band, to calculate an optimum transhybrid balance impedance from said input data, and to transmit said optimum transhybrid balance impedance to a user for further processing, wherein said processor further compares said return loss values contained within said input data to each return loss profile of said plurality of stored return loss profiles, and calculates an absolute difference between said input data and said each return loss profile for said each frequency.
